

How to run my program (README)

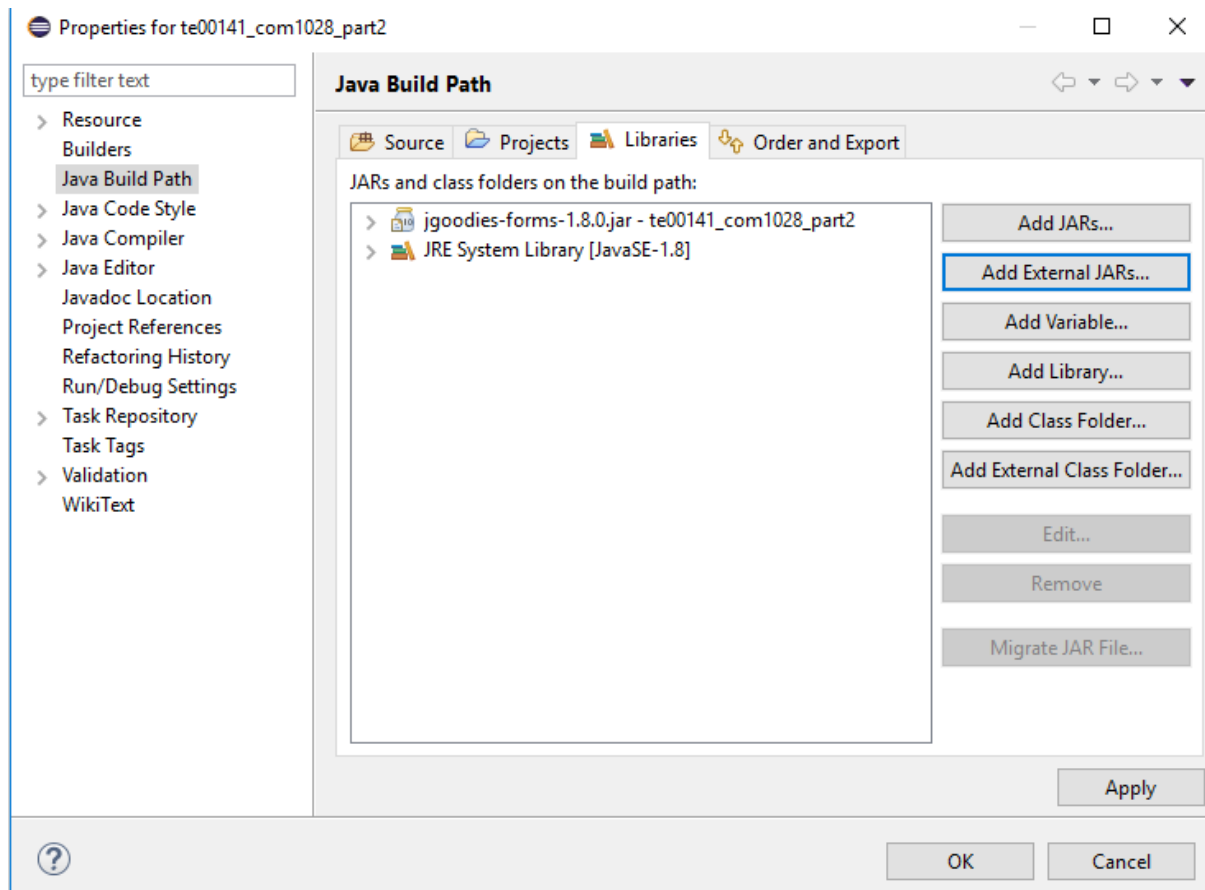

1. Download **ALL** files submitted (including JAR file)
2. Import project into eclipse
3. Right click referenced libraries in left page like below:

4.

Delete the sqlite folder that is displayed above and replace with the one that has been downloaded on your machine, by selecting “Add External JARs” and inserting the sql connector that has been provided with submission. Click Apply then OK.

Go to the SQLiteDatabase class and change this line to the directory that you have downloaded the niledatabase.db file.

```
public void open() {  
    try {  
        Class.forName("org.sqlite.JDBC");  
        this.con = DriverManager.getConnection("jdbc:sqlite:C:\\Software Engineering CW part 2\\te00141_com1028_part2\\niledatabase.db");  
        System.out.println("Connected");  
    }  
}
```

Change the line highlighted in yellow to the directory that you have saved the database file.
